

AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application

1 - 13 (Canceled)

14. (New) A connector device for the production of an electrical connection between a mains cable and a cable harness in an electrical device, especially a household appliance, comprising a first plug-in connector for establishing a detachable mechanical and electrical connection to the cable harness of the electrical device, and a second plug-in connector for establishing a detachable mechanical and electrical connection to the mains cable, wherein the second plug-in connector is provided for a plurality of different mains cables and has an identical connector configuration for each of the different mains cables.
15. (New) The connector device according to claim 14, wherein at least the second plug-in connector is configured such that after plugging together with the connector contact plug of the mains cable, the second plug-in connector is protected from penetration of dripping or splashed water.
16. (New) The connector device according to claim 14, wherein the connector device is configured to include an interference suppression filter and the housing of the connector device is constructed to detachably receive the interference suppression filter.
17. (New) The connector device according to claim 16, wherein the detachable receiver is formed by at least one plug connection constructed in the housing.

18. (New) The connector device according to claim 16, wherein the plug connection forms a plug contact which takes over the electrical contacting of the interference suppression filter in addition to the mechanical holding thereof.
19. (New) The connector device according to claim 16, wherein the interference suppression filter has a charge storage device.
20. (New) The connector device according to claim 16, wherein the interference suppression filter has an inductance.
21. (New) The connector device according to claim 20, wherein conductor tracks for producing the electrical connection between the mains cable and the cable harness are provided therein which can be separated by means of a separating device for breaking the electrical connection.
22. (New) The connector device according to claim 20, wherein the interference suppression filter has a discharging resistor.
23. (New) The connector device according to claim 14, wherein the first plug-in connector is a group plug with a plurality of contact elements.
24. (New) A connection system comprising a connector device for the production of an electrical connection between a mains cable and a cable harness in an electrical device, especially a household appliance, comprising a first plug-in connector for establishing a detachable mechanical and electrical connection to the cable harness of the electrical device, and a second plug-in connector for establishing a detachable mechanical and electrical connection to the mains cable, wherein the second plug-in connector is provided for a plurality of different mains cables and has an identical connector configuration for each of the different mains cables, the mains cable having a corresponding connector contact plug with an identical

configuration regardless of the design of the mains contact plug and comprising a cable harness whose plurality of electrical conductors can be connected to the connector device by means of a single plug-in contact connection.

25. (New) A household appliance dishwasher, in particular, a washing machine or a laundry drier, comprising a handling element for handling items disposed in the household appliance, an electrical device associated handling element, and a connector device for the production of an electrical connection between a mains cable and a cable harness in the electrical device, the connector device including a first plug-in connector for establishing a detachable mechanical and electrical connection to the cable harness of the electrical device, and a second plug-in connector for establishing a detachable mechanical and electrical connection to the mains cable, wherein the second plug-in connector is provided for a plurality of different mains cables and has an identical connector configuration for each of the different mains cables.
26. (New) The household appliance according to claim 25, wherein the connector element is a component of a connection system in which the mains cable have a corresponding connector contact plug with an identical configuration regardless of the design of the mains contact plug and the connection system includes a cable harness whose plurality of electrical conductors can be connected to the connector device by means of a single plug-in contact connection
